Apodaka, Marije; Quintana, Gotzon; Ugarte, Bea. Partaidetza: gurekin bada, izango da.

The people responsible for this article are putting forward a didactic proposal based on participation and solidarity. They offer a definition for participation, explain key conditions for participation and analyse methodological ideas on educational systems.

Raudsepp, Lennart; Neissaar, Inga. Brief report: Relationships between physical activity and depressive symptoms in adolescent girls.

This study examined the relationships between changes in physical activity and depressive symptoms in adolescent girls (12-13 years old). Participants were 277 urban adolescent girls from Estonia. Data were collected on three occasions over a 3-year period. The results of latent growth modelling indicated that initial level and change in physical activity was inversely associated with initial status and change in depressive symptoms. The associations were independent of body mass index. Our results encourage the design of interventions that reduce depressive symptoms and increase physical activity of early adolescent girls.

Meneses, Carmen (...et al.) Concurrencia de comportamientos de riesgo entre adolescentes españoles.

This work examines the co-occurrence of risk behaviors among Spanish adolescents. The analyzed behaviors were sexual activity, the use of alcohol and other drugs, violent conduct and behaviors related to driving mopeds or scooters. The sample consisted of 4,091 adolescents between the ages of 13 to 18, all of them enrolled in one of the four compulsory years of secondary education. Cluster analysis indicates that there are four risk profiles. Differences have been found among the various profiles according to sociodemographic characteristics such as sex, grade, perception of the family's economic situation and ethnicity. The findings are discussed and some suggestions are given for prevention intervention.
